Are you a parent with a child between the ages of 4 - 11?
Come learn about your child’s development!

Researchers at the UC Davis MIND Institute are carrying out a new study on the relationship between emotional and independent living skill development in children with and without chromosome 22q11.2 deletion (VCFS/DiGeorge) syndrome and how parenting can influence their child.

Who can participate?

Parents with children 4 to 11 years old who either:
- Have chromosome 22q11.2DS (also known as Velocardiofacial or DiGeorge syndrome), or
- Are typically developing.

What does the study involve?

- Parents and children will visit the MIND Institute for an estimated 3-4 hours. Together they will work on activities such as puzzles and folding origami.
- Completing questionnaires about parenting and your child’s behavior.
- IQ testing.
- For families with children who have 22q11.2DS, a history and physical examination will be completed by our clinician.

What are the benefits?

- Receive a $40 gift card!
- We will provide an assessment report summary that includes IQ scores!

Sign up for research
